

# BARN DOOR TRACK SYSTEM

*Built for you by Mikron*

**While other tracks offer similar functionality, these systems lack the ability to be adjusted. Our fully adjustable track system allows you to attach to existing studs or any strong mounting point within the track's length.**

Fully adjustable mounting points make installation easy. No advanced planning is required to make proper blocking and an integrated cam in the wheel mounts allow for simple micro adjustments to door height.

## Why use our track system?

- Track hangers are independent from the track, which allows anchoring directly to the stud or weight bearing support
- Track hanger holes are slotted to allow adjustment up to 1/8" to achieve proper leveling
- Spacers are included to enable adjustment of hangers out from the wall in 1/8" increments up to 7/8" (standard hanger is 3/4")
- Door stop can be placed anywhere along the track
- Aluminum parts are anodized
- Weight limit up to 125lbs per track hanger when lag screws are fastened to studs or equivalent support structure (A maximum of 24" between track hangers recommended; All 4 track hangers should be used for each full 80" length track system)
- Cam in the wheel system allows height to be adjusted from 0" to 1/4" up or down once door is hung
- Standard 80" aluminum track can easily be cut to size, then capped off with included end caps
